Problem 3 (P7: 4). Let  $\alpha:(0,\pi)\to\mathbf{R}^2$  be given by

$$lpha(t) = \left(\sin t, \cos t + \log an rac{t}{2}
ight)$$
 ,

where t is the angle that the y axis makes with the vector  $\alpha(t)$ . The trace of  $\alpha$  is called the tractrix (Fig. 1-9). Show that

- (a)  $\alpha$  is a differentiable parametrized curve, regular except at  $t=\pi/2$ .
- (b) The length of the segment of the tangent of the tractrix between the point of tangency and the y axis is constantly equal to 1.

Proof.

(a) Let  $x(t) = \sin t$ ,  $y(t) = \cos t + \log \tan \frac{t}{2}$ , then

$$x'(t)=\cos t; \;\; y'(t)=-\sin t+rac{1}{\sin t}.$$

It's trivial that both x'(t) and y'(t) are infinitely differentiable in  $(0,\pi)$ , so  $\alpha$  is a differentiable parametrized curve.

$$x'(t)=0, y'(t)=0 \Longleftrightarrow t=rac{\pi}{2}, ext{ so } lpha ext{ is regular except at } t=\pi/2.$$

(b) The intersection of y axis and the tangent of the tractrix is  $\left(0,y(t)-\frac{y'(t)}{x'(t)}x(t)\right)$ . The length of the segment of the tangent of the tractrix between the point of tangency and the y axis is  $\sqrt{x(t)^2+\left(\frac{y'(t)}{x'(t)}x(t)\right)^2}$ 

$$egin{aligned} x(t)^2 + \left(rac{y'(t)}{x'(t)}x(t)
ight)^2 &= \sin^2 t \left(1 + \left(rac{y'(t)}{x'(t)}
ight)^2
ight) \ &= \sin^2 t \left(1 + \left(rac{-\sin t + rac{1}{\sin t}}{\cos t}
ight)^2
ight) \ &= \sin^2 t \left(1 + \left(rac{1 - \sin^2 t}{\sin t \cos t}
ight)^2
ight) \ &= \sin^2 t \left(rac{1}{\sin^2 t}
ight) \ &= 1 \end{aligned}$$

So the length of the segment of the tangent of the tractrix between the point of tangency and the y axis  $=\sqrt{x(t)^2+\left(\frac{y'(t)}{x'(t)}x(t)\right)^2}=1.$ 

**Problem 5** (P47: 6). Let  $\alpha(s)$ ,  $s \in [0, l]$  be a closed convex plane curve positively oriented. The curve

$$\beta(s) = \alpha(s) - rn(s),$$

where r is a positive constant and n is the normal vector, is called a parallel curve to  $\alpha$  (Fig. 1-37). Show that

- (a) Length of  $\beta = length$  of  $\alpha + 2\pi r$ .
- (b)  $A(\beta) = A(\alpha) + rl + \pi r^2$ .
- (c)  $\kappa_{eta}(s) = \kappa_{lpha}(s)/(1 + r\kappa_{lpha}(s)).$

For (a)-(c),  $A(\cdot)$  denotes the area bounded by the corresponding curve, and  $\kappa_{\alpha}$ ,  $\kappa_{\beta}$  are the curvatures of  $\alpha$  and  $\beta$ , respectively.

Proof.

(a) Length of  $\beta$  is

$$\int_0^l ||eta'(s)||ds = \int_0^l ||lpha'(s) - rn'(s)||ds.$$

By definition of normal vector n,  $n'(s) = -\kappa(s)\alpha'(s)/||\alpha'(s)||$ . Therefore, the length of  $\beta$  equals

$$egin{aligned} \int_0^l ||eta'(s)||ds &= \int_0^l ||lpha'(s) + r\kappa(s) rac{lpha'(s)}{||lpha'(s)||}||ds \ &= \int_0^l ||(1+rac{r\kappa(s)}{||lpha'(s)||})lpha'(s)||ds \ &= \int_0^l (1+rac{r\kappa(s)}{||lpha'(s)||})\cdot ||lpha'(s)||ds \ &= \int_0^l ||lpha'(s)||ds + r\int_0^l \kappa(s)ds \ &= ext{length of } lpha + 2\pi r. \end{aligned}$$

(b) Let D and D' denote the region bounded by  $\alpha$  and  $\beta'$ . By Green's theorem,

$$\iint_{D} dx dy = rac{1}{2} \left\| \oint_{0}^{l} lpha imes lpha' ds 
ight\|_{z}^{z}; \iint_{D'} dx dy = rac{1}{2} \left\| \oint_{0}^{l} eta imes eta' ds 
ight\|_{z}^{z}$$

, where  $\|\cdot\|_z$  denotes the z-component of a vector , and then

$$egin{aligned} \oint_0^l eta imes eta^l ds &= \oint_0^l (lpha - rn) imes (lpha - rn)^l ds \ &= \oint_0^l lpha imes lpha^l ds + r^2 \oint_0^l n imes n^l ds + r \oint_0^l (lpha^l imes n - lpha imes n^l) ds \ &= \oint_0^l lpha imes lpha^l ds - r^2 \oint_0^l n imes (-\kappa lpha^l / ||lpha^l||) ds \ &- r \oint_0^l (lpha imes n)^l ds + 2r \oint_0^l lpha^l imes n ds \ &= \oint_0^l lpha imes lpha^l ds - r^2 \oint_0^l n imes (-\kappa lpha^l / ||lpha^l||) ds \ &- (lpha imes n)^l_{s=0}) + 2r \oint_0^l lpha^l imes n ds. \end{aligned}$$

Since the third term of the last value is zero and that  $lpha' imes n = \|lpha'\| e_z$ ,

$$egin{aligned} A(eta) &= \left\|rac{1}{2}\oint_0^l lpha imes lpha' ds - rac{r^2}{2}\oint_0^l n imes (-\kappalpha'/||lpha'||) ds + r\oint_0^l lpha' imes n ds
ight\|_{2} \ &= &A(lpha) + rac{r^2}{2}\oint_0^l \kappa ds + r\oint_0^l ||lpha|| ds = A(lpha) + \pi r^2 + rl\,. \end{aligned}$$

Problem 8 (Curvature is a geometric object I.). X(s) = (x(s), y(s)), where s is the arc-length parameter.

$$M=\left[egin{array}{ccc} a_{11} & a_{12} \ a_{21} & a_{22} \end{array},
ight]M^t=M^{-1}, \emph{i.e.} ~M~\emph{is orthogonal}.$$

Let  $ar{X}(s)=M\cdot\left[egin{array}{c} x(s) \ y(s) \end{array}
ight]+\left[egin{array}{c} lpha \ eta \end{array}
ight]$  ,  $lpha,eta\in\mathbf{R}$  . What is the relation between  $\kappa_X(s)$  and  $\kappa_{ar{X}}(s)$ ?

Problem 9 (Curvature is a geometric object II.). X(t) = (x(t), y(t)) be a regular curve. Let

$$\kappa(x(t),y(t)) \equiv \kappa(t) = rac{\left|egin{array}{cc} x' & y' \ x'' & y'' \end{array}
ight|}{\left(x'^2+y'^2
ight)^{rac{3}{2}}}$$

Let Y(u) = X(t(u)),  $t'(u) \neq 0$ . Discuss the relation of  $\kappa(x(t), y(t))$  and  $\kappa(x(t(u)), y(t(u)))$  at the corresponding points.

Problem 10. Let F(x, y) = c defines a plane curve. Prove that the curvature of the curve satisfies

$$|\kappa| = \left| egin{array}{ccc} \left[ & F_y, & -F_x \end{array} 
ight] \left[ egin{array}{ccc} F_{xx} & F_{xy} \ F_{xy} & F_{yy} \end{array} 
ight] \left[ egin{array}{ccc} F_y \ -F_x \end{array} 
ight] } \ \left[ egin{array}{ccc} F_x^2 + F_y^2 
ight]^{rac{3}{2}} \end{array} 
ight|$$

Where  $F_x^2 + F_y^2 \neq 0$ .

*Proof.* Let  $\alpha$  be a point in the plane such that  $F(\alpha)=c$ . Consider the circle of curvature passing through  $\alpha$ . If we observed the intersection of two line respectively perpendicular to the lines tangent to F=c and passing respectively through  $\alpha$  and another point  $\alpha' \in F=c$ , the intersection approaches the centre of the circle o as  $\alpha' \to \alpha$ . Thus,

$$|\alpha' - \alpha| = r \sin \theta$$
,

where  $\theta$  is the angle between the vectors  $o - \alpha$  and  $o - \alpha'$ . By the formula of exterior product,

$$\sin heta = rac{|(o-lpha) imes(o-lpha')|}{|o-lpha||o-lpha'|}$$

Let n denote  $\nabla F/|\nabla F|$  rotated counterclockwise by  $\pi/2$ . Since  $\alpha'-\alpha$  is perpendicular to  $\frac{\nabla F(\alpha)}{|\nabla F(\alpha)|}$ , and since  $o-\alpha$  and  $o-\alpha'$  are respectively parallel to  $\frac{\nabla F(\alpha)}{|\nabla F(\alpha)|}$  and  $\frac{\nabla F(\alpha')}{|\nabla F(\alpha')|}$ , we obtained
